Alert source (web UI / webhook)
Incident Commander
Responder
Logs / Metrics / Deploy / Runbook
Scribe
FixAgent
alert payload → composed report (no LLM)
invoke_agent(report)
1 open_ticket(service, desc) → recall_incidents(service)
INC1200## "In Progress" + suggested_hotfix
2 loki_logs / prometheus_metrics /
github_deployments (or deploy_lookup) / runbook_search
event timestamps + error rate + deploy record +
runbook match, each labelled fixture/live
3 draft hypothesis (names the service verbatim)
+ all gathered evidence
correlation_check
(coded tool)
re-derives incident/deploy
timestamps from source data
SUPPORTED / NOT_SUPPORTED
verdict + reasoning
4 [if SUPPORTED] service_name + exact failing
error line(s) from LogsAgent
read_source_file →
submit_code_fix
(sandbox checks)
verified diff, checks passed
5 finalize_incident() → records memory,
preflights repair if SUPPORTED; update_ticket(work_note)
report: ticket, verdict, runbook, hotfix,
evidence sources – ticket stays In Progress
final answer + sly_data (ticket #, verified facts)
UI shows answer, ticket card, "Verified by tools"
human reviews PR diff + CI, approves merge,
Sentinel verifies recovery, resolves ticket
